

# Instructions for Using LJ-3041 Scraper Sharpener

1. Mount the Scraper Sharpener in the Chuck-Buster™ (3031) or directly into the chuck of an electric drill motor, or in a router. The Scraper Sharpener is most effective if used in a router with a 1/2" collet. Lock the 1/2" diameter portion (never the 3/8" hex portion) of the scraper sharpener in the collet.

2. With the sharpener spinning in the chuck, touch the profile edge of the scraper to be sharpened. Move along the edge of the scraper keeping the rod on the sharpener parallel to the edge of the scraper. The spinning action of the carbide rod "rolls" an edge on the scraper.

Note: the "rolled" edge produced through this procedure is not "sharp" like a knife edge, but will produce a fine curly chip when using the scraper.
